Dear Hiring Manager,

I'm writing to express my interest in a Full-Stack Software Engineer role at your company. With over five years of experience architecting and shipping production platforms across sports-tech, healthtech, and gaming, I bring hands-on expertise across the full stack — from Django REST Framework and FastAPI on the backend to React.js, Next.js, and Angular on the frontend, backed by AWS cloud infrastructure.

In my current role as Software Engineer II at SimStar Asia Ltd, I develop scalable REST APIs in FastAPI and Python, with PostgreSQL as the primary data store. I optimized a core service's database queries and reduced API response times by 25%, while also building secure authentication flows using JWT, OAuth2, and Pydantic validation, and containerizing services with Docker as part of our CI/CD pipeline.

Previously, as Senior Software Developer at Techibears Pvt Ltd, I led end-to-end development on six-plus production platforms, including Pi-Play and Just Padel — multi-city sports-booking platforms supporting slot-based reservations, split payments via Razorpay and Amazon PayFort, and public/private match creation with community features. I also built a serverless healthtech platform (VirtuScreening) on AWS Lambda, API Gateway, and MySQL, and automated media pipelines using AWS Lambda, S3, and Elastic Transcoder for video and image processing. Across these projects I've owned architecture decisions end-to-end — API design, database schema, cloud infrastructure, and frontend delivery — rather than working in a single layer of the stack.

I'm currently expanding my skills in Docker, Kubernetes, and AI-assisted workflows with LangChain and LangGraph, and I'm looking for a full-stack role where I can continue owning systems end-to-end and contribute to architecture decisions from day one. I'd welcome the opportunity to discuss how my background could contribute to your team.

Thank you for your time and consideration.

Sincerely,
Kamlesh Gupta
